SILVER SQUILL

Light

Give the silver squill a bright light such as a south or west window. If light isn't bright enough, the leaves will stretch toward the light.

Bright indirect

Watering

Water thoroughly and then let the soil dry out partially before watering again. Because the bulbs above the medium store moisture, they can take a bit of dryness. Yet, if it is allowed to dry too much, the plant will lose its leaves.

Feeding

Feed every month during the growing season with a balanced houseplant fertilizer, such as Espoma Organic Indoor Houseplant Food.

Planting & Care

Grow this plant in a well draining potting soil, we recommend Black Gold® Cactus Mix.

Size

This plant stays under 10 inches tall

Flower

The tiny flowers are on stems that rise above the foliage an inch or two. Each flower is pink, green, and white, and quite beautiful; unfortunately, they are very small. When they bloom find a magnifying glass and look at them closely.

Temperature

60-75°F

Humidity

Low

Care

Easy
